Highlights

Conformal Prediction for Realized Volatility across Market Regimes

- Conformal volatility intervals promised 90% cover only 83% of stress days.
- Pooling calibration across stocks repairs most of the stress deficit.
- Per-regime thresholds add conditional structure and per-regime guarantees.
- Stress-day VaR backtests improve on GARCH-t, CAViaR, and conformal baselines.
- Day-2-of-spike coverage resists every scheme evaluated: a persistent onset limitation.
